

```
sysadmin@localhost:~$ echo *
Desktop Documents Downloads Music Pictures Public Templates Videos
sysadmin@localhost:~$
```

The asterisk *

matches "zero or more" characters in a file name. The `echo` command, in turn, displays the filenames that were matched.

```
sysadmin@localhost:~$ echo D*
Desktop Documents Downloads
sysadmin@localhost:~$
```

Think of the first example, `D*`, as "match all filenames in the current directory that begin with a capital `d` character and have zero or more of any other character after the `D`".

```
sysadmin@localhost:~$ echo *s
Documents Downloads Pictures Templates Videos
sysadmin@localhost:~$
```

The asterisk `*` can be used anywhere in the string. The following command will display all the files in your current directory that end in the letter `s`:

```
sysadmin@localhost:~$ echo D*n*s
Documents Downloads
sysadmin@localhost:~$
```

means:

- Starts with **D**
- Followed by **zero or more characters**
- Then **n**
- Followed by **zero or more characters**
- Ends with **s**

```
sysadmin@localhost:~$ echo ??????  
Public Videos
```

Each ? character must match exactly one character in a filename-no more and no less than one character.

```
sysadmin@localhost:~$ cp /etc/hosts hosts  
sysadmin@localhost:~$ ls  
Desktop    Downloads  Pictures   Templates  hosts  
Documents  Music      Public     Videos  
sysadmin@localhost:~$
```

Cp - Copied the system hosts file to current directory for analysis

```
sysadmin@localhost:~$ rm hosts  
sysadmin@localhost:~$ ls  
Desktop Documents Downloads Music Pictures Public Templates Videos  
sysadmin@localhost:~$
```

`rm` command is used to delete a file

```
sysadmin@localhost:~$ touch premove  
sysadmin@localhost:~$ ls  
Desktop    Downloads  Pictures   Templates  premove  
Documents  Music      Public     Videos  
sysadmin@localhost:~$
```

Creates an empty file called `premove`

```
sysadmin@localhost:~$ mv premove postmove  
sysadmin@localhost:~$ ls  
Desktop    Downloads  Pictures   Templates  postmove  
Documents  Music      Public     Videos
```

This command “cuts” the `premove` file and “pastest” it to a file called `postmove`
